EduTrack - False Positives Documentation

1. ApexCRUDViolation in ClassManagementController.cls

Location: Line 1830

Description of Flag:

The PMD scanner flagged this line for an ApexCRUDViolation, suggesting that CRUD/FLS permissions should be validated before the SOQL operation or user mode should be enforced.

Reason for False Positive:

This specific SOQL query retrieves internal configuration data that is fundamentally required for the managed package to operate. It does not access or expose sensitive user data. If FLS/CRUD were enforced here, it would break core functionality for users who might have restrictive profiles but still need the application to perform background processing.

Mitigation:

We intentionally bypass standard CRUD/FLS here using system mode, but we ensure that no sensitive or user-provided data is exposed to the UI or modified maliciously. All other user-facing queries use WITH SECURITY_ENFORCED.
